

„ Space ” high compensating elements

Also your customers judge your company by his methods of working. Therefore a company only can flourish if the signs of time are recognized and new methods are fast used. This knowledge was taken into consideration at the development of Space.

Grundraster

Space consists of a plan-parallel disk with wedge-shaped declined piece, seven material recesses and a groove with funnel-shaped insertion. There are hold lips which prevent a slipping out in horizontal and vertical position within this groove. Clip-in toothing and guiding ridges are appropriate at the topside and underside of the plan-parallel disk. Space is made from Polyethylene or Polypropylene and is fully recycling capable therefore. The thermal load capacity suffices from $-15\text{ }^{\circ}\text{C}$ to $75\text{ }^{\circ}\text{C}$. In everyone of the combinations specified down in the diagram Space has a load-bearing capacity of 1,3 t at full thrust face without deforming thereby.

The advantages of Space are thus obvious!

No contraction, also not under load;

Insertion groove, click-in toothing and guide ridges prevent a slipping in any direction;

Hold lips prevent a slipping out at vertical use;

A breaking off or splinter off is excluded most largely by use of Polyethylen or Polypropylene;

Only a Space-wedge is required in more than 50% of utilization possibilities, that means that doesn't need any counter-wedge;

There are only four different color designed basic elements which are arbitrarily combinable in two sizes of raster (rough or fine) and ensure a good handling.

The advantages economic for you are:

The cut of little wood pieces and wedges is dropped and lowers the expenditure of work;

Highest quality standard, thereby avoidance of reworking;

High industrial safety by omission of adaption work.

Our reference companies save money per roof to labor costs at application of Space. This saving corresponds more than the tenfold purchase price. This means a large use for you at a small price.
